

Trends in Cell Biology

February 2026, Volume 36, Number 2, pp. 83–176

Spotlight

- 83 **Where you start could determine where you end up** *Cecilia A. Leber and Hani S. Zaher*

Opinion

- 86 **Capabilities and challenges for the use of fluorescent RNAs in RNA dynamics research** *Mengyue Fang, Ying Jiang, Xianjun Chen, and Yi Yang*

Feature Review

- 100 **Proteoglycans are protagonists in autophagy, lymphangiogenesis, and neurodegenerative diseases** *Gabriel J. Pascal, Sadie Kim, Christopher Xie, Dipon Mondal, and Renato V. Iozzo*

Reviews

- 114 **Stem-like cells at the center of CD4 T cell differentiation** *Maria A. Cardenas and Haydn T. Kissick*
- 125 **Navigating AKT-ivity across cellular compartments** *Jichao Sun and Mo Chen*
- 142 **Time as a danger signal promoting G1 arrest after mitosis** *Luke J. Fulcher, Caleb Batley, Tomoaki Sobajima, and Francis A. Barr*
- 154 **The Wnt–NAD⁺ axis in cancer, aging, and tissue regeneration** *Jillian Lamprecht, Sundos Abu Sanad, Anjali P. Kusumbe, and Shukry J. Habib*

Correction

- 175 **Regulation of lipid droplet dynamics and lipid homeostasis by hydroxysteroid dehydrogenase proteins** *Bin Liang, Lin Fu, and Pingsheng Liu*

On the cover: In this issue, Lamprecht *et al* review the dynamic interplay between Wnt signaling and cellular metabolism across the aging process. The contrasting human profiles and surrounding molecular motifs represent age associated changes in Wnt pathway activity, shaped by metabolic regulators such as NAD. Central visual elements illustrate how NAD dependent metabolic states modulate Wnt signaling to influence stem cell maintenance and tissue regeneration over time, while Wnt signaling itself feeds back to regulate cellular NAD levels and metabolic homeostasis. Together, the image highlights the emerging concept that metabolic decline and Wnt signaling are tightly interconnected and mutually influential drivers of aging biology. Cover design by Leen Abu Sanad.
